

# Myth Busting

**Myth #1 – Vaccines are safe.** – Dictionary states SAFE – Free from harm.

**Reality #1** - Vaccines kill and damage millions every year worldwide – USA have a compensation fund paying out billions in 20 years. Why bring out new safer vaccines if the ones already out are safe.

Drug company definition of safe: will not kill or damage the majority – but is this even true? 1 in 110 children now have autism in Australia (1 in 88 in USA); childhood cancer , asthma, juvenile diabetes, juvenile arthritis, ADD, ADHD, leukaemia, eczema, ear infections, Alzheimer's disease – all epidemics caused by vaccines.

Drug company product inserts state many side effects – all damaging. Clear proof vaccines are NOT safe.

**Myth #2 – Vaccines stop you from getting a disease and it is the unvaccinated spreading the diseases.**

**Reality #2** - The majority of people who contract the disease, were in fact fully vaccinated according to government figures. The 2008/12 whooping cough epidemic in Australia shows most of the disease in the fully vaccinated. In 1991 there were 318 cases of whooping cough with a vaccination rate of 71% - in 2008 there were 14,522 cases of whooping cough with a vaccination rate of over 95%. Further proof vaccination is not effective. The condition of your immune system determines whether you get a disease and its severity. If it is the vaccinated getting the disease it is the vaccinated spreading the disease. Proof it is NOT effective at stopping diseases.

**Myth #3– Vaccination got rid of smallpox?**

**Reality #3** - If smallpox is gone, why does vaccination against it in African countries and some third world countries continue? When mass vaccination campaigns commenced for smallpox, the disease was more than 90% gone. The 90% decline has been attributed to better sanitation and hygiene, better nutrition, housing and isolation procedures. This is also true for polio and nearly all diseases.

**Myth #4 – Herd Immunity states we need 85 – 95% of the population vaccinated to get rid of disease.**

**Reality #4** – Herd immunity is a theory . There is no proof this theory is correct but plenty of proof it is not – fully vaccinated communities time and time again are getting the diseases they have been vaccinated against. Most whooping cough right now in Australia is in the fully vaccinated. This alone proves herd immunity is a myth.

**Myth #5 – I was vaccinated as a child and I am OK and also my child has had no reactions.**

**Reality #5** – Whilst many children do have a reaction at the time of vaccination, many have reactions later. The majority of people don't know what the vaccine reactions are. Many people have had ear infections, eczema and many other conditions/illnesses soon after vaccinations and are unaware they are listed on product inserts as a reaction. The reaction time is dependent on how the individual copes with the assault of the toxins in vaccines to the immune system, nervous system, organs and brain. People cope differently depending on their genetic make-up, previous history and tolerance for toxins. Some reactions, e.g. autism, ADD / ADHD, arthritis, diabetes, cancer and asthma to name but a few, can take years to manifest as you don't know what your body is manifesting now as an adult , that had its roots in the vaccinations you received as a child.

Thirty years ago people received 3 or 4 shots in their entire childhood, now it is about 20 shots by the time you are 12 months old.

**Myth #6 – Vaccines are the only disease prevention option available.**

**Reality #6**– Vaccines raise the antibody level in some people for varying amounts of time. The antibody level is one of many natural defences the body has for fighting disease, viruses and bacteria. A high antibody level alone has never been SCIENTIFICALLY proven to provide immunity – they just 'think' it does. The best option to prevent disease is to keep the immune system in great condition. This is achieved with what nature provided. Healthy food, sunshine, quality water, adequate sleep, fresh air and a loving environment. A more natural alternative to drug company vaccines is Homoeopathic prophylaxis. In one large-scale study, more than 18,000 children were successfully protected with a homeopathic remedy (Meningococcinum IICH) against meningitis, with no side effects (BMJ, 1987;294-6).

**Myth #7 – Vaccination is free and the Government would not be recommending it if it wasn't a good thing.**

**Reality #7** – Vaccination is not free – it is paid for by every tax payer! Governments get their information about vaccines from the medical researchers on various boards. These researchers are mostly funded by or have ties to drug companies. Medical universities are also heavily funded by drug company money. The ongoing cost to the community for the side effects is immense.

**Myth #8 – Vaccination is compulsory to attend childcare and school**

**Reality #8** – Vaccination is not compulsory in Australia. In some states you have to show your child's immunisation records for enrolment at school. If you do not have one, you only need to state this. Some private childcare centres and preschools have discriminated against unvaccinated children by not allowing them entry. Find a centre that doesn't discriminate against any kids.

**Myth #9 – I will lose my Government benefits if I don't vaccinate**

**Reality #9** – You cannot be financially penalized for not vaccinating your child. It's in the legislation. All needs to be done is to get a conscientious objection form signed by a doctor and submitted to the HIC. If this is too difficult, a Statutory Declaration will suffice.

**Myth #10 – People should vaccinate for the good of the community**

**Reality #10** – It has been centuries since human sacrifice has been accepted by civilized communities. Why is it OK when it comes to vaccination?

**Myth #11 – Parents who don't vaccinate their children are irresponsible and neglectful.**

**Reality #11** – An irresponsible parent is one who just follows the herd and does not make a truly informed decision.

**Myth #12 – My doctor would not do anything to harm me or my child**

**Reality #12** – Most Doctors know little about vaccinations. They are fed information by drug companies so they learn what drug companies want them to know. They learn in drug company funded universities. They are ignorant to the reality of what is going on because they believe information from 'official' sources only, which is biased. Yes, they would not knowingly harm people – but they unfortunately do harm nearly every day they are practicing on people.
